

- SCALE OF THE PROBLEM

wp2shell got the headlines. 93 other bugs shipped patches the same week.

July 17–24, 2026 was a genuinely bad week for WordPress security.

02/07

93

**vulnerabilities
disclosed in one
week**

Across core, plugins, and themes.

Not a slow month. One week.

03/07

NOT OBSCURE PLUGINS

Yoast SEO and BuddyPress were on the list.

Two of the most widely installed plugins in WordPress — not fringe tools nobody's heard of.

Most sites run a dozen or more plugins.

The odds that at least one shipped a patch still sitting there uninstalled aren't small. They're likely.

05/07

FOR AGENCIES

Now multiply that across every client site you manage.

Dozens of sites, each with a dozen-plus plugins, each needing a human to notice a patch shipped. That doesn't scale.

THE REAL RISK

It's not one bug. It's a stack nobody's watching.

A single unpatched plugin is how most WordPress compromises actually happen — quietly, not dramatically.

• TALKTOWP

One dashboard. Every client site.

TalktoWP flags outdated plugins across your whole fleet automatically. And if a bad update breaks one site, every other TalktoWP user gets warned before they install it.
