

• THIS WEEK, RECAPPED

Most site owners find out something's wrong from a customer complaint.

Not from their own dashboard. That's the pattern behind almost every WordPress compromise.

02/07

WHAT WE COVERED

wp2shell let attackers in with no login at all.

Confirmed under active attack by CISA within four days of the patch shipping.

03/07

AND

A backdoor was hiding in a folder your Plugins screen never shows.

Plus 93 other bugs that shipped patches the same week,
including in Yoast SEO and BuddyPress.

The 3-step check, one more time:

- 01 Confirm your WordPress version is up to date
- 02 Update every plugin with a pending patch
- 03 Check `/wp-content/mu-plugins/` for anything unfamiliar

05/07

THE PATTERN

A site nobody's watching stays exposed by default.

Not by accident. Continuous monitoring catches this automatically — without anyone remembering to go looking.

WHAT TALKTOWP DOES

Checks every site it watches, every 3 minutes.

Plain-English alerts. Step-by-step fixes. Written the way a senior developer would explain it to a client — not a cryptic error log.

• TALKTOWP

Don't wait for a customer to tell you something's wrong.

Free for one site. No card required. Setup takes about 60 seconds.
